The world wide web is made from millions of interlinked webpages. Discover how it was founded and how it has grown and changed over the years.Â The first websites were made up of simple pages of just words and pictures, a bit like online books or magazines. Most people couldnâ€™t create their own webpages. Back then, to make a webpage you had to write HTML code by hand. Despite its increasing role in communication, the world wide web remains the least controlled medium: any individual or institution can create websites with unrestricted number of documents and links. While great efforts are made to map and characterize the Internet's infrastructure, little is known about the topology of the web. Here we take a first step to fill this gap: we use local connectivity measurements to construct a topological model of the world wide web, allowing us to explore and characterize its large scale properties.
