As pre-construction sediment transport data are unavailable and land-use is 145 both spatially and temporally constant between reaches, this study makes the reasonable assumption that the 146 reference reach on the Dalligan is representative of pre-dam conditions regarding channel characteristics and 147 sediment regime (sensu Stanley et al., 2002; Skalak et al., 2009; MacVicar et al., 2015). The median particle size was shown to be 15% coarser in the 372 DALDS relative to DALR, and 45% and 22% coarser in the DUGDS relative to DUGAI and DUGTrib, 373 respectively. In order to determine if the presence of a low-head dam was having an
