

# Illness Behaviors: A Comparison of Responses to Descriptions of Symptom-experiences by Children and Their Mothers. University of Wisconsin--Madison, 1973. 1973. Kathy Behlke Atwood

Although studies of illness behavior have concentrated on utilization of formal services, recent research has highlighted the importance of lay care. In this article, patterns of self-treatment of symptoms among a sample of older people living in community settings are explored. Data were collected through personal interviews and health diaries completed by a probability sample of 667 elderly people. A majority of respondents managed most symptoms on their own. A decision to take no action was a common response to a number of symptoms. Prescription and over-the-counter medications were the most illness behavior is influenced by the child's psychosocial issues (psychological distress, social functioning, coping mechanisms, and life stress), parental pathology (physical symptoms and psychological distress), and social learning of illness behavior (via modeling of symptoms and illness behavior to the child and reinforcement of the child's sick role through operant conditioning) (18). Our initial sample consisted of 117 children and their maternal guardians enrolled from three North Carolina schools. Medical consulting behavior in rap. Table 3. descriptions of measures of a 51-item validated questionnaire assessing how mothers encourage child's illness behavior through solicitude, monitoring and Signs And Symptoms Of Abnormal Behavior in Children. 8 Common Behavioral Problems In Children. When To Get Help. But if the child's responses are threatening others or self, then you need to pay attention to what they say and handle it carefully. Do not respond impulsively. Let the child calm down and then address what he or she said. Parents should keep their children at home and do not contact with them. During the incubation period, people take from 3 to 8 days to identify the symptoms and infection of this fever. In the infectious period, the patients just need to use antibiotics in 3 days, then, scarlet fever will disappear. 6. Mouth, Hand And Foot Disease. Some drugs just support people to improve health and prevent some symptoms of this disease. To compare with other common childhood diseases, RSV lasts longer for one to two weeks. Reye's syndrome is a very common childhood illness. If children don't be cured this disease in the right way, they can suffer other serious illnesses till the end of their life. According to doctors, people should not allow children to take a lot aspirin for avoiding stomachache. Children have a high risk of psychosomatic disorders associated with such qualities of character as a low sensitivity threshold to stimuli, high intensity of reactions to external stimuli, difficulties in adapting to changes with a predominance of negative emotions. Identified the personal characteristics that are most often in different combinations to meet almost all psychosomatic disorders. Child is a symptom of a dysfunctional family, and painful symptoms it may be the only expression of family disruption. Qualitative disorders of the behavior of the mother can lead to such symptoms: refusal of feeding, vomiting in newborns, three-month colic in children, infant eczema, constant and intense rocking on all fours etc. Manifestations of psychosomatic disease in a child.
