In order to characterize and classify soils on one topo sequence at federal college of education (Technical) Umunze, Anambra State, in southeastern Nigeria, three pedons were dug, at 100m apart respectively on one typical hillslope and studied with regards to their morphological, physical and chemical properties. Palustrine wetlands in Lesotho are vulnerable to vegetation loss due to overgrazing and the nature of the topography, the latter leading to gully erosion exacerbated by a degraded soil structure. Degraded soils are not able to adsorb pollutants; neither can they support vegetation growth.
